Acetate stretch knit type.
The fiber material of "acetate" is the combination of acetic acid with cellulose. Acetate is semi-synthetic fiber which is made with spun filaments of cellulose taken from wood pulp. MATT SOIL is made of dull di-acetate which has a matte surface and is free from clinging.
Please note that this quality might be getting worn down by friction. Therefore, it is recommended to use a laundry net when washing. Also, please note that it might have color bleeding when using light and dark color in one pattern.

DESCRIPTION

MATT SOIL is a dull type of acetate stretch.
Acetate is a semi-synthetic fiber made with spun filaments of cellulose taken from wood pulp. The acetate used for this yarn is a combination of this cellulose and acetic acid.
For MATT SOIL, a dull di-acetate is used for its matt shine and reduced clinging. Please note that the shine will be affected by friction. We recommend the use of a laundry net when washing. As SOIL is prone to color bleeding, avoid using light and dark colors beside each other.

WASHING INSTRUCTION

Note: - Handwashing is recommended with cleaning net.
